

It's Freezing!

It's so cold this week. We have the perfect weather for some ice investigations.

Try half filling a container (not glass!) with water and leaving it outside overnight. The pop out in the morning and see what happened. Did it freeze? Did it freeze all the way through or just on top? Or do you just have very cold water?

If you have no outdoor space of your own, perhaps you could try a windowsill or use the freezer as an alternative.

Now, what else will freeze?

Does Jelly freeze outside? Does Juice freeze? What about salted water?
